

User Persona: Johnny Evatt

Overview

A working adult who plays in an amateur football team, using a web app to stay organized around matches and training. Needs quick, reliable ways to check updates, share availability, message teammates, and handle last-minute changes without disrupting work or family life.

Demographic Information

Age: 29

Location: Torquay, UK

Occupation: Project Coordinator (9–5, occasional overtime)

Household: Lives with partner, no kids

Tech: Comfortable with web apps on mobile; uses laptop at work

Background and Context

Plays Sunday league and midweek training. Commutes by public transport. Balances football with work deadlines, social commitments, and occasional weekend trips. Communication historically split across WhatsApp, email, and spreadsheets; prefers a single source of truth that works well on mobile.

Goals and Motivations

Wants to know match details, kit color, and any last-minute changes without chasing the group chat. Aims to give coaches clear availability early, adjust when work or travel changes, and keep in touch with teammates for logistics and morale. Values reliability, speed, and minimal fuss.

Pain Points and Frustrations

Misses updates when information is scattered. Finds long message threads noisy and hard to search. Last-minute work changes create stress when canceling; worries about letting the team down. Dislikes clunky forms, slow pages, and unclear confirmation of status changes. Wants fewer duplicate reminders.

Behaviors and Preferences

Checks the app in the morning commute and after work. Updates availability when schedules become clear, often week-by-week. Uses mobile browser most; expects responsive design and quick actions. Prefers concise announcements over chat noise, with clear read receipts. Wants one-tap availability toggles, calendar sync, and a simple way to message a captain or small group. Expects notifications that are timely, controllable, and actionable.

Quote

“I just need to know where to be and if I’m in. Make it quick to update my status—especially when plans change last minute.”

Implications for Product Teams

- Mobile-first, fast-loading UI with offline tolerance for spotty connections.
- Central announcements feed with pinning, read receipts, and change history.
- One-tap availability and last-minute cancel with reason; notify staff automatically.
- Clear confirmations, undo window, and audit trail for changes.
- Threaded messaging per match/training and targeted DMs; limit noise.
- Calendar sync (ICS) and smart reminders tied to role and status.
- Flexible notification controls and quiet hours; email fallback for critical updates.
